GLENVIEW RECEIVES LEGACY TREE PROJECT GIFT – 4th YEAR OF PROTECTING ASH TREES FROM EMERALD ASH BORER

May 20, 2013 – This year marks the fourth year that Glenview is participating in the Legacy Tree Project, a partnership with Valent Professional Products aimed at building community awareness about the threat posed by emerald ash borer.

The ash borer, which kills all native species of ash trees, was first confirmed in Glenview in November 2008. At that time, ash trees comprised 22 percent of the parkway trees in Glenview. The ash borer is now present throughout the Village and widespread in the region. Up to this point, the death rate of unprotected trees has been deceptively slow and manageable. However the tipping point is near, and tree death will increase rapidly. Trees will now die just one to three years after first signs of infestation. And in just a few years, only treated ash trees will remain.

Through the Legacy Tree Project, Glenview is receiving five years of treatment for more than 200 ash trees with Safari®, a systemic insecticide in the Valent product line. This comes at no expense to the Village. The Legacy Tree Project covers all material and labor costs from 2010 through 2014.

Robyn Flakne, Natural Resources Manager for Glenview says, “Trees enrolled in the Legacy Tree Project can be seen on Patriot Boulevard, Glenview Road and at the Public Works Department campus on Shermer Road. In contrast to untreated trees in the area, many of the trees treated with the insecticide have denser canopies, deeper green color to the leaves and better branch elongation.”

Village Actions

In Glenview, over 1,200 infested parkway trees have been removed or marked for removal since 2008 due to the emerald ash borer infestation. Of the more than 5,000 estimated ash trees on Village property, Glenview is treating almost 600 using different products and application methods. Many of the trees are being treated at no cost to

Village taxpayers, including the trees enrolled in the Legacy Tree Project and several large-diameter trees enrolled in a Morton Arboretum research project.

To date, Glenview has received two \$20,000 reforestation grants to replace parkway trees lost to the emerald ash borer.

What Can You Do?

“Should homeowners wish to attempt to save their ash trees, treating them now is essential,” Flakne said.

More information about the ash borer, including symptoms of infestation and treatment options, is available on Glenview’s website at http://www.glenview.il.us/public_works/SitePages/Emerald%20Ash%20Borer.aspx and at www.emeraldashborer.info and www.agr.state.il.us/eab/?pg=28.

Legacy Tree Project Details

Safari is applied by soil injection at the base of each tree. This work will be completed by certified professionals with The Davey Tree Expert Company. Safari is a “systemic” insecticide, taken up by the roots and distributed throughout the tree. Soil injection precludes contact with pets or people. The active ingredient in Safari is also used in flea control products for pets.
